

AI Usage in Student Placements & Education

EU AI Act Perspective & Assessment Guide

Overview

The EU AI Act classifies AI systems into four tiers: Minimal Risk, Limited Risk, High-Risk, and Prohibited Risk. AI tools impacting education and employment face rigorous compliance criteria because they directly govern academic paths, candidate evaluations, and career opportunities.

Assessment of Common Student AI Use Cases

AI Use Case	EU AI Act Perspective	Risk Level
Résumé Editing	Writing & formatting assistance; fully permissible.	MINIMAL RISK
Mock Interviews	Generative training and diagnostic practice tools.	MINIMAL RISK
Essays / SOP Drafting	Permitted help; institutional transparency rules may apply.	MINIMAL RISK
GitHub Projects	Standard coding co-piloting and productivity support.	MINIMAL RISK
Skill Assessment	Self-directed interactive learning and educational tools.	MINIMAL RISK
Graded Assignments	Regulated if integrated into formal automated grading metrics.	POTENTIALLY HIGH
Fake CGPA Generation	Constitutes absolute credential fraud and misrepresentation.	LEGAL/ETHIC RISK
Voice-Cloned Interview	Undisclosed synthetic deepfakes violate core transparency.	HIGH-RISK ISSUE

Key EU AI Act Principles

Employment AI Regulation: AI systems applied within candidate lifecycle management (screening, filtering, interview scoring, and automated application profiling) are explicitly designated as **High-Risk**. System operators must guarantee human oversight, algorithmic fairness, extensive transparency, bias auditing, and thorough trace logs.

Transparency & Evaluation: Mandated disclosure rules apply across synthetic digital avatars, cloned media, and predictive educational AI tools used directly to execute academic grading, university admissions, or structural ranking matrices.

Consultant Recommendation

Generally Acceptable (Productivity & Learning) Leveraging interactive self-tutoring tools, refining styling/grammar on professional summaries, generating mock prep queries, automated code debugging, and individual proficiency metrics tracking.
Risky or Unethical (Deception & Compliance Violations) Falsifying baseline qualifications, deploying undisclosed deepfake audio layers during synchronous hiring loops, identity impersonation, and opaque AI employment to bypass genuine evaluation protocols.

Conclusion

The EU AI Act permits standard productivity tools (like ChatGPT) for drafting and learning. However, boundaries tighten into high-risk mandates when tools influence recruitment tracks, academic grading, or

identity checks. **Best practice:** Support, do not deceive; declare usage where necessary; avoid credential falsification.
